Talk with your child about mammals, and compare to humans. Discuss that most mammals are helpless when they are babies. Adult mammals protect and help care for babies until they can survive on their own. The mammal most famous for caring for their babies is the mother kangaroo who carries their babies in their pouch until they are about one year old. Mammals like mice, only care for their young for about one month. Elephants care for their young a long time, up to ten years. Talk about how long your child thinks their parents will care for them!
